

Tier-1 operating model for an engineering consulting company: prospect need → governed issue → reusable knowledge/data/code → traceable analysis pack. Every repo label is a clickable GitHub link.

What Mo/Stephane can review

- Pick one representative Doris problem, structure, pipeline, or installation case.
- A&CE converts it into a starter automation pack with caveats and traceability.
- Doris reviews outputs against senior-engineer judgment before production use.

Tier-1 repo links reviewed

workspace-hub

- AI control plane
- Issue/plan/review gates
- Cross-repo standards

digitalmodel

- Engineering calculations
- Offshore/subsea workflows
- OrcaFlex/AQWA/FEA outputs

assetutilities

- Shared utilities
- Units/config/CLI helpers
- Report/data plumbing

worldenergydata

- Energy datasets
- BSEE/EIA/drilling inputs
- Data prep pipelines

llm-wiki

- Knowledge storehouse
- Public methodology corpus
- Retrieval context for agents

aceengineer-website

- Public proof surface
- Brochures/case studies
- Client-facing credibility

aceengineer-strategy

- Private GTM operations
- Prospect/pilot tracking
- Proposal strategy notes

assethold

- Business evidence
- Finance/portfolio analytics
- Budget and decision support

Why this matters

- Faster option screening before teams commit heavy engineering hours.
- Reusable code/data/knowledge instead of one-off spreadsheets.
- GitHub traceability for assumptions, tests, issues, and report versions.

Governance: Issue → plan → adversarial review → user approval → TDD implementation → verified closeout.

Engineering scope: subsea pipelines, rigid jumpers, vessel suitability, OrcaFlex/AQWA/ANSYS extensions.

Caveat: public artifact only; client-specific data and confidential details stay out of public repos.

Operating promise: repeatable studies become reusable software assets; AI agents handle orchestration, tests, and review evidence; senior engineers focus on assumptions, governing checks, and client decisions.
